Hi, Taejeong.

Three options.

1) Delay creating the subdriver until startOfData() or detectorChanged().

```
public void startOfData()
{
    new C(x,y,z);
}
```

2) Flatten out the structure and don't use subdrivers. Then you call each driver individually in your xml file.

3) Set the value in the parent driver's setter method.

```
class A
{
    int x;
    B b;
    public A()
    {
        b = new B();
    }

    public void setX(int x)
    {
        this.x = x;
        b.setX(x);
    }
}
```

Does this answer your question?
